ILLINOIS POWER

Part of the Dynegy Performance Team

Imagine. You cover one-fourth of the State of Illinois with electricity and natural gas. You serve almost 1 million customers managing thousands of miles of rural roads and hundreds of substations in snowstorms, windstorms, heat waves, and floods. Your nearly 2,000 people need maps of every township, quarter section, substation, and streetlight, every transformer, switch, fuse, valve, and regulator station. The data are trapped in thousands of maps, some with a year-year update backlog.

So what do you do?

You tap ASI to meet your geospatial information system (GIS) challenge. You need accuracy, seamless integration, and remote map viewing. You don't want to re-engineer your workflow. You need out-of-the-box technology. ASI begins with a pilot project, migrating a small rural area, then a large urban one establishing system-wide guidelines. They implement a map-viewing tool for corrections in the field, and accuracy improves exponentially. All 17,000 square miles of your map data reside on a single CD-ROM.

Success

With facilities data are linked to planning and analysis you see new opportunities. The use of standard construction designs climbs to 85%. Material delivery is streamlined and documented. Costs are down, productivity up. Within two hours of a storm prediction, your crews are mobilized and viewing digital maps in the field.
