

ASI
delivering solutions

ride the light
Qwest.

Imagine. Your 1,200 wire centers serve 25 million people and businesses

throughout the Midwest and West via a 1.7-million-mile fiber optic network. You have paper-based phone records, engineering work orders, maps and plat data, distribution maps, air pressure schematics, underground feeder schematics, and conduit records. You also have 200,000 engineering work orders that aren't posted to their plant locations. Your landbase files and plan location records are in different computer file formats. In all, you have millions of units of data your people need to access. Without you, nobody connects.

So what do you do?

To enhance your facilities data management and transmission analysis – you select ASI for conversion of your 40 wire centers. Plant records are scanned into a TIF file format for uploading, then integrated with newly converted landbase and facilities maps and drawings. ASI initiates posting of your work orders including plotting the 200,000 backlog sheets and matching them with each engineering work order. Now, thanks to your partnership with ASI, each work order has a unique tracking stamp. ASI is also updating and maintaining your ASCII log files, keeping the right documents matched with the correct files.

Success

Finally, your workforce can map the territory they've covered. And when it comes to productivity, cost reductions and timesavings, you see lots of new connections.

Data Solutions That Power Your Business
